

1). Write a JavaScript program to convert temperatures to and from Celsius, Fahrenheit.

[Formula : $c/5 = (f-32)/9$ [where c = temperature in Celsius and f = temperature in Fahrenheit]

Expected Output :

60°C is 140 °F

45°F is 7.222222222222222°C

2). Write a JavaScript program to get the difference between user given number and 16, if the number is greater than 16 return double the absolute difference

3). Write a JavaScript program to construct the following pattern, using a nested for loop.

```
*
* *
* * *
* * * *
* * * * *
```

```
6 <body>
7 <script>
8 function cToF(celsius)
9 {
10     const cTemp = celsius;
11     const cToFahr = cTemp * 9 / 5 + 32;
12     const message = cTemp + "C in Fahrenheit = " + cToFahr;
13     document.write(message);
14 }
15
16 function fToC(fahrenheit)
17 {
18     const fTemp = fahrenheit;
19     const fToCel = (fTemp - 32) * 5 / 9;
20     const message = fTemp + "F in celsius = " + fToCel + "<br>";
21     document.write(message);
22 }
23 cToF(60);
24 fToC(45);
```

```

25 2).
26
27 function difference(n)
28 {
29     if (n <= 13)
30         return 13 - n;
31     else
32         return (n - 13) * 2;
33 }
34 var gnum = prompt('Enter a number less than 56');
35 document.write(difference(gnum));
36
37

```

```

38 3). var x,y,chr;
39 for(x=1; x <=6; x++)
40 {
41     for (y=1; y < x; y++)
42     {
43         chr=chr+"*";
44     }
45     document.write(chr);
46     chr="<br>";
47 }
48
49 </script>
50 </body>
51 </html>

```

4).

Identify the attack.

An explicit attempt by attackers to prevent legitimate users of a service from using that service

Cross Site Scripting (CSS for short, but sometimes abbreviated as XSS) is one of the most common application-level attacks that hackers use to sneak into web applications today

Attacker execute malicious SQL statements

An explicit attempt by attackers to modify a legitimate domain name service.

5). Discuss Asymmetric cryptography and symmetric key cryptography

6). What is the difference between cookie and session

1. Cookies are client-side files that contain user information, whereas Sessions are server-side files that contain user information.
2. Cookie is not dependent on session, but Session is dependent on Cookie.
3. Cookie expires depending on the lifetime you set for it, while a Session ends when a user closes his/her browser.
4. The maximum cookie size is 4KB whereas in session, you can store as much data as you like.
5. Cookie does not have a function named unsetcookie() while in Session you can use Session_destroy(); which is used to destroy all registered data or to unset some

7). Briefly Explain the following three terms with respect to Information Security.

1. Confidentiality – _____

Integrity -

Availability -

7). Briefly Explain the following three terms with respect to Information Security.

1. Confidentiality – _____

Integrity -

Availability -

8). 03). People's care bank wants to create an online loan calculator (refer to Figure 03). You are supposed to create admin interface, capture admin inputs, check the eligibility of a loan and update the table in MYSQL database.

- Figure 01 shows the table structure of the table loanDetails in the database.
- Figure 02 shows all loan records in loanDetails table in the database.
- Figure 03 shows the sample user interface for bank admin.
- You must write a single PHP code to generate the required report.
- Write your source code in the given space (You can change the given code structure).
- Following account given you to access the database server and the required table.

§ Database server: localhost

§ Database name: bank_db

§ Username: bank_user

§ Password: @user#321

| # | Name | Type | Collation | Attributes |
|---|------------|--------------|--------------------|------------|
| 1 | cid | int(11) | | |
| 2 | cName | varchar(150) | utf8mb4_general_ci | |
| 3 | income | int(11) | | |
| 4 | duration | int(11) | | |
| 5 | loanAmount | int(11) | | |
| 6 | status | varchar(20) | utf8mb4_general_ci | |

Figure 01 - table structure

| cid | cName | income | duration | loanAmount | status |
|-----|------------------|--------|----------|------------|--------|
| 1 | P.K.L Nilaweera | 65000 | 4 | 1200000 | No |
| 2 | S.O Samaranayaka | 125000 | 5 | 1500000 | Yes |
| 3 | N.T De Silva | 90000 | 5 | 2500000 | No |
| 4 | H.K Uduwana | 75000 | 3 | 1000000 | yes |

a) Write a "config.php" to create a mysqli database connection object.

(6 marks)

| | |
|--|----------|
| <?php | |
| // Create database connection using config file | |
| <u>\$servername</u> = "localhost"; | |
| <u>\$username</u> = "root"; | |
| <u>\$password</u> = ""; | |
| <u>\$dbname</u> = "employee"; | 02 marks |
| | |
| // Create connection | |
| <u>\$conn</u> = new <u>mysqli</u> (<u>\$servername</u> , <u>\$username</u> , <u>\$password</u> , <u>\$dbname</u>); | 02 marks |
| // Check connection | |
| if(<u>\$conn->connect_error</u>) { | 01 mark |
| <u>die</u> ("Connection failed: " . <u>\$conn->connect_error</u>); | 01 mark |
| } | |

b) Construct html page ("loanCalclater.php") to display the belw form (refer figure 01)

1. Import "config.php" file
2. Read all the data using "select "from loanDetails table and display them in a table shows as below.
3. Write a form below the table to capture user inputs.
4. Your form method should be post and action page name should be insertLoanDetails.php.

(22 marks)

Figure 01 : LoanCalclater.php

| | |
|---|---------|
| require (" <u>config.php</u> ") | 2 marks |
| <table width="80%" border=1> | 1 mark |
| <tr> | |
| <th>Customer ID</th> <th>Customer Name</th>> <th>Address</th> | 2 marks |
| <th>Monthly Income</th><th>Loan | |
| Duration</th><th>Amount</th><th>Loan Status</th> <tr> | |
| <u>\$sql</u> = "SELECT * FROM <u>loanDetails</u> ORDER BY <u>cid</u> 'DESC'"; | 2 marks |
| //without order by <u>cid</u> DESC give full marks | |
| <u>\$result</u> = <u>mysqli_query</u> (<u>\$conn</u> , <u>\$sql</u>); | 2 marks |
| <u>while</u> (<u>\$row</u> = <u>\$result->fetch_assoc</u> ()) { | 2 marks |
| | |
| <u>\$sql</u> = "SELECT address FROM <u>clientDetails</u> where <u>icid</u> = <u>\$row["cid"]</u> "; | |
| <u>\$result</u> = <u>mysqli_query</u> (<u>\$conn</u> , <u>\$sql</u>); | |
| <u>\$address</u> = <u>\$result->fetch_object</u> (); | |

| | |
|--|---------|
| | |
| | |
| echo "<tr>"; | |
| echo "<td>" . \$row['cid'] . "</td>"; | |
| echo "<td>" . \$row['cName'] . "</td>"; | |
| echo "<td>" . \$address . "</td>"; | |
| echo "<td>" . \$row['income'] . "</td>"; | |
| echo "<td>" . \$row['duration'] . "</td>"; | 5 marks |
| echo "<td>" . \$row['loanAmount'] . "</td>"; | |
| echo "<td>" . \$row['status'] . "</td>"; | |
| | |
| echo "</tr>"; | 1 mark |
| } | |
| } | |
| } | |
| ?> | |

| | |
|---|--------|
| <form method = "post" action = " <u>insertLoanDetails.php</u> " > | 1 mark |
| Customer Name: <input type = "text" name = " <u>txtEno</u> " size = "50" > | 1 mark |
| Monthly income: <input type = "text" name = " <u>txtEname</u> " size = "50" > | 1 mark |
| Loan Duration: <input type = "text" name = " <u>txtDuration</u> " size = "50" > | 1 mark |
| Loan Amount: <input type = "text" name = " <u>txtAmount</u> " size = "50" > | 1 mark |
| <input type = "submit" name = " <u>btnInsert</u> " value = "Save Info" > | 1 mark |
| </form> | |
| | |

c). Complete insertLoanDetails.php by adding php codes for following requirements.

1. Import "config.php" file.
2. Capture all the user inputs you received from "loanCalclater.php"
3. Define the loan status using below equation.

Interest Rate = 9.5%

Monthly loan payment (MP) = ((109.5/100)* loanamount)/duration in months

If (MP < ((60/100) * monthly income)

Status = "yes"

Else

Loan Status = **no**

Ex: First customer status calculation

$MP = ((109.5/100) * 1200000) / 4 * 12 = 27,250$

$MP < 65,000$

Loan Status = yes

4. Insert data in to "loandetails" table using insert query.

(25 Marks)

| | |
|---|---------|
| <u>require ("config.php");</u> | 2 marks |
| <u>\$cName= \$ _POST['txtEname'];</u> | |
| <u>\$income= \$ _POST['txtIncome'];</u> | 4 marks |
| <u>\$duration= \$ _POST['txtDuration'];</u> | |
| <u>\$amount= \$ _POST['txtAmount'];</u> | |
| <u>\$mp = ((109.5/100)*\$amount)/\$duration*12</u> | 5 marks |
| <u>(If (\$mp < ((60/100) * \$income))</u> | |
| <u>\$status = "yes";</u> | 5 marks |
| <u>else</u> | |
| <u>\$status = "no";</u> | |
| <u>\$sql= INSERT INTO loandetails Values</u> <u>(\$cName,\$income,\$duration,\$amount);</u> | 3 marks |
| <u>if (\$conn->query(\$sql) === TRUE) {</u> <u>echo "New record created successfully";</u> <u>} else {</u> <u>echo "Error: " . \$sql . " " . \$conn->error;</u> <u>}</u> | 6 marks |
| <u>\$conn->close();</u> | |
